

## Alexa On-Board Mains Power Supply

Oppenheimer Camera Products introduces our new Alexa On-Board Mains Power Supply at Cine Gear Expo 2011 in Hollywood. This system is simply the most advanced and complete AC power solution available for your Alexa camera. The features of this system provide for all of your

power needs with the long term reliability you require.

The system provides universal world power capability from 90-264VAC at 50/60Hz. It mounts easily to the Gold Mount or V Mount battery plate of the Alexa, mechanically, but NOT electrically. Electrically, it provides 28VDC power from its outlet to the camera's 2-pin Fischer inlet with a custom cable. Users can, if needed, interchange the Power Supply mounting between Gold Mount and V Mount. The system weighs less than 3 pounds (<1.3kg) and is physically smaller than an AB Hytron 140 battery. It is fan cooled, but with an extremely quiet fan, no louder than that in the Alexa camera.

The Power Supply includes four accessory ports, supplying one 14V outlet in the Arri standard 2-pin

Lemo, plus three 28V outlets in the Arri standard 3-pin Fischer. The total capacity of the Power Supply is 250 watts. This gives you more than 100 watts of headroom over what the camera (and its own accessory ports) might draw. That should be enough for whatever accessories you attach to your Alexa!

The system is housed in an attractive custom enclosure, powder coated for durability. The components have been selected for uncompromised reliability. The main components are rated at more than 3,000,000 hours! We have paid careful attention to build quality. Because of this, we are happy to warranty the Alexa OB Mains Power Supply for one full year against manufacturing defects.

Deliveries will begin in July 2011.
